

Legend

-  Extent of Unit Boundaries
 -  Existing Coastal Environment Boundary (200m inland from MHWS)
- Assessment addressed either the coastal marine area (within an estuary/inlet) or the coastal marine area plus the terrestrial coastal environment as proposed. In the case of the catchments surrounding the Ruataniwha and Whanganui Inlets, the recommended coastal environment boundary was not able to be fully defined and assessed - as not all of the imagery was available at the time of assesment

Tasman District natural character measurement case studies: unit boundaries & unique identifiers

Overview Map

This is part of Envirolink project 1009-TSDC 80. Please refer to the full report (Froude, V.A. 2012 *Refining new methodology for measuring coastal natural character using case studies in Tasman District*. Report for Envirolink Project 1009-TSDC 80) for the natural character indices, scores and specific parameter information
